

STARTECT®

PROTECT. PROLONG. PERFORM.

FAST
FACTS

A unique combination novel active drench, containing derquantel and abamectin. It is a highly effective, short acting oral sheep drench designed to kill key production limiting parasites, and help protect against drench resistance on farm.

APPROVED FOR SHEEP

Active ingredients: 10 mg/mL derquantel, 1 mg/mL abamectin.

INDICATIONS

For the treatment and control of a broad range of susceptible adult and immature (L4) gastrointestinal nematodes of sheep, including those resistant to macrocyclic lactones (ML), levamisole/morantel (clear), benzimidazoles (white) and closantel based drenches, and combinations of these. For the treatment and control of lungworm, nasal bot and itch mite.

FEATURES & BENEFITS

- Derquantel is the first member of the novel family of anthelmintics, the Spiroindoles (SIs), and has a completely unique mode of action compared to all other anthelmintics.
- Formulating derquantel in a combination has the potential to extend the life of this new active by slowing the development of resistance.
- When used as part of a routine drench programme, Startect also extends the useful life of older drenches by cleaning up resistant worms that have survived previous drenches
- Well tolerated at up to 3x the dose rate.
- Safe to use in lambs, ewes and rams.
- Use from six weeks of age or heavier than 15kg.

ADMINISTRATION

Dose: Sheep and lambs 1 mL per 5kg by mouth. Retreatment interval 28 days.

It is recommended that Startect be used with the Startect 20 mL ST Drench Gun, as it has silicone O-rings.

Extremely toxic to horses. Do not use in other species.

WITH-HOLDING PERIODS

Meat 14 days; Milk 35 days.

PACK SIZES

5L and 15L.

STORAGE

Store below 30°C (room temperature).

Protect from direct sunlight.

Contents should be used within 24 months after first opening.
